# A short course in effective theories

# Introduction

The basic ideas behind effective field theory

# Introduction

#### The SM is incomplete

- No  $\nu$  masses
- No DM
- No gravity

Presumably due to new physics

... but who knows where it lurks.

Two possibilities: look for new physics:

- directly  $\rightarrow$  energy limited
- ullet in deviations form the SM ightarrow luminosity limited

The goal is to find the  $\mathcal{L}_{\mathsf{NP}}$ – easier if the NP is observed directly

SM deviations usually restrict but do not fix the NP.

In particular, two interesting possibilities:

- NP = SM extension: The SM fields  $\in \mathcal{L}_{NP}$  (example: SUSY)
- NP = UV realization: the SM fields are generated in the IR (example: Technicolor)

# Basic EFT for the SM idea

Begin with S<sub>light</sub>[light-fields]

Assume the NP is not directly observable

 $\Rightarrow$  virtual NP effects will generate deviations from  $S_{light}$  predictions

The EFT approach is a way of studying this possibility systematically

EFT course - HRI

# THE GENERAL EFT RECIPE

- Choose the light symmetries
- Choose the light fields (& their transformation properties)
- Write down *all* local operators  $\mathcal{O}$  obeying the symmetries using these fields & their derivatives

$$\mathcal{L}_{eff} = \sum c_{\mathcal{O}} \mathcal{O}$$

The sum is infinite; yet the problem is *not* renormalizablity, but predictability

# $\mathcal{L}_{ ext{eff}}$ is renormalizable. Any divergence:

- polynomial in the external momenta
- obeys the symmetries
- $\Rightarrow$  corresponds to an  ${\cal O}$
- $\Rightarrow$  renormalizes the corresponding  $c_{\mathcal{O}}$

The real problem: at first sight,  $\mathcal{L}_{\text{eff}}$  has no predictive power

 $\infty$  coefficients  $\Rightarrow \infty$  measurements

However, there is a hierarchy:

$$\{\mathcal{O}\}=\{\mathcal{O}\}_{\text{leading}}\cup\{\mathcal{O}\}_{\text{subleading}}\cup\{\mathcal{O}\}_{\text{subsubleading}}\cdots$$

Eventually the effects of the  $\mathcal{O}$  are below the experimental sensitivity.

The hierarchy depends on classes of NP:

- UV completions: a derivative expansion
- Weakly-coupled SM extensions: dimension

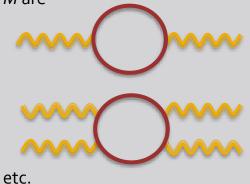

•

3.2017

EFT course - HRI

Imagine QED with a heavy fermion  $\Psi$  of mass M

All processes at energies below *M* are

- Each term is separately gauge invariant
- There are no unitarity cuts since energies < M</li>

$$\mathcal{L} = -\frac{1}{4}F_{\mu\nu}F^{\mu\nu} + \bar{\Psi}(i\partial \!\!\!/ - M + e \!\!\!/ A)\Psi$$

$$e^{iS_{\Psi}} = \int [d\Psi \, d\bar{\Psi}] \exp\left[i \int d^4x \, \bar{\Psi} \left(i\partial \!\!\!/ - M + e \!\!\!/ A\right) \Psi\right]$$

$$S_{\Psi} = \ln \det[i\partial - M + eA] + \text{const}$$

$$= -i \operatorname{trln} \left[ \mathbb{1} + \frac{1}{i\partial - M} eA \right]$$

$$= i \sum_{n=1}^{\infty} \frac{(-e)^n}{nM^n} \operatorname{tr} \left( \frac{1}{i\partial / M - 1} A \right)^n$$

$$n = 2: \qquad \frac{i}{2}e^2 \int d^4x \, d^4y \, A^{\mu}(x) G_{\mu\nu}(x-y) A^{\nu}(y)$$
$$G_{\mu\nu} = G_{\nu\mu} \,, \quad \partial^{\mu} G_{\mu\nu} = 0$$

Since the full theory is known  $G_{\mu \nu}$  can be obtained explicitly

There is a divergent piece  $\propto$   $C_{UV} = 1/(d-4) + finite$ 

The divergent piece is unobservable: absorbed in WF renormalization

Observable effects are:

- $\propto$  1/ $M^{2n} \Rightarrow \underline{Hierarchy}$
- $\propto e^{2n}/(16 \pi^2)$

 $\Rightarrow$  all observable effects vanish as  $M \to \infty$ 

The expansion is useful only if energy < M

Loop suppression factor: relevant since the theory is weakly coupled

$$G_{\mu\nu}(x) = \int \frac{d^4k}{(2\pi)^4} e^{ik.x} \left(k^2 \eta_{\mu\nu} - k_{\mu} k_{\nu}\right) \mathcal{G}(k^2)$$

Required by gauge invariance

$$\mathcal{G}(k^2) = \frac{1}{2\pi^2} \left\{ \frac{1}{6} C_{UV} - \int_0^1 du \, u(1-u) \ln\left[1 - u(u-1)\frac{k^2}{M^2}\right] \right\}$$
$$= \frac{C_{UV}}{12\pi^2} + \frac{1}{60\pi^2} \frac{k^2}{M^2} + \frac{1}{560\pi^2} \left(\frac{k^2}{M^2}\right)^2 - \frac{1}{3780\pi^2} \left(\frac{k^2}{M^2}\right)^3 + \cdots$$

$$S_{\text{eff}} = \int d^4x \left[ -\frac{1 + 2\alpha C_{UV}/3}{4} F_{\mu\nu} F^{\mu\nu} + \frac{\alpha}{30M^2} F_{\mu\nu} \Box F^{\mu\nu} - \frac{\alpha}{280M^4} F_{\mu\nu} \Box^2 F^{\mu\nu} + \cdots \right] + O(e^4)$$

If we don't know the NP:

- Symmetries: U(1) & SO(3,1)
- Fields:  $A_{\mu}$

U(1):  $A_{\mu} \rightarrow F_{\mu\nu}$ [Wilson loops: non-local]

F<sup>2</sup> terms: change the refraction index

F⁴ terms ⊃ Euler-Heisenberg Lagrangian (light-by-light scattering).

NP chiral  $\Rightarrow$   $\mathcal{L}_{\mathsf{eff}}$   $\supset$   $\epsilon_{\mu
u
ho\sigma}$ 

NP known:  $c_{\mathcal{O}}$  are predicted

NP unknown:  $c_{\mathcal{O}}$  parameterize all possible new physics effects

EFT fails: energies  $\geq \varLambda$ 

$$\mathcal{L}_{\text{eff}}^{(2)} = \sum \frac{c_n^{(2)}}{\Lambda^{2n}} F_{\mu\nu} \Box^n F^{\mu\nu} , \quad \left[ F_{\mu\nu} \Box^n \tilde{F}^{\mu\nu} = 2\partial_\mu \left( 2A_\nu \Box^n \tilde{F}^{\mu\nu} \right) \to \text{drop} \right]$$

$$\mathcal{L}_{\text{eff}}^{(4)} = \frac{c_1^{(4)}}{\Lambda^2} \left( F_{\mu\nu} F^{\mu\nu} \right)^2 + \frac{c_2^{(4)}}{\Lambda^2} \left( F_{\mu\nu} F^{\nu\rho} F_{\rho\sigma} F^{\sigma\mu} \right) + \frac{c_3^{(4)}}{\Lambda^2} \left( F_{\mu\nu} F^{\mu\nu} \right) \left( F_{\mu\nu} \tilde{F}^{\mu\nu} \right) + \frac{c_2^{(4)}}{\Lambda^2} \left( F_{\mu\nu} F^{\nu\rho} F_{\rho\sigma} \tilde{F}^{\sigma\mu} \right)$$

# $\mathcal{L}_{\mathsf{eff}}$ for the SM

# Construct all $\mathcal{O}$ assuming:

- low-energy Lagrangian =  $\mathcal{L}_{\mathsf{SM}}$
- ullet The  ${\cal O}$  are gauge invariant
- The O hierarchy is set by the canonical dimension
- ullet Exclude  ${\cal O}'$  if  ${\cal O}' \propto {\cal O}$  on shell (justified later)

("on shell" means when the equations of motion are imposed)

Equivalence thm.

# **Equivalence theorem**

Low-energy theory with action  $S_0 = \int d^4x \mathcal{L}_0$ 

Effective Lagrangian

$$\mathcal{L}_{ ext{eff}} = \mathcal{L}_{ ext{light}} + \sum c_{\mathcal{O}} \mathcal{O}$$

Two effective operators  $\mathcal{O}$ ,  $\mathcal{O}'$  such that

Some constant

$$a\mathcal{O} - \mathcal{O}' = \mathcal{A}(\phi) \frac{\delta S_{\text{light}}}{\delta \phi}$$

A local operator

Generic light field

EFT course - HRI 3.2017 19

# Then the S-matrix depends only on

$$c_{\mathcal{O}} + a c_{\mathcal{O}}$$

Not on  $c_{\mathcal{O}}$ ,  $c_{\mathcal{O}}$ , separately.

Without loss of generality one an drop either  ${\cal O}$  or  ${\cal O}'$  from  ${\cal L}_{\rm eff}$ 

What this means: the EFT cannot distinguish the NP that generates  $\mathcal{O}$  from the one that generates  $\mathcal{O}'$ 

Simple classical Lagrangian

 $L = \frac{1}{2}m\dot{x}^2 - V$ 

Add a term vanishing on-shell

 $L \to L - \epsilon A(x)(m\ddot{x} + V') + O(\epsilon^2)$ 

 $\rightarrow L + \epsilon (mA'\dot{x}^2 - AV') + \text{tot. der.} + O(\epsilon^2)$ 

Find the canonical momentum and Hamiltonian

 $p = \left(\frac{\partial L}{\partial \dot{x}}\right) = m(1 - 2\epsilon A')\dot{x}$ 

 $=H_0+\epsilon H'+O(\epsilon^2)$ 

 $H = p\dot{x} - L = \frac{1}{2m}p^2 + V + \epsilon\left(-\frac{1}{m}A'p^2 + AV'\right) + O(\epsilon^2)$ 

Quantize as usual (with an appropriate ordering prescription)

The quantum Hamiltonian is

Which is equivalent to the original one

Also:

then

 $UpU^{\dagger} = p - \frac{1}{2}\epsilon\{p, A'\} + O(\epsilon^2)$ 

 $A'p^2 \to \frac{1}{4}\{\{p,A'\},p\} = \frac{1}{4}(p^2A' + 2pA'p + A'p^2)$ 

 $H = \frac{1}{2m}p^2 + V + \epsilon \left(-\frac{1}{4m}\{\{p, A'\}, p\} + AV'\right) + O(\epsilon^2)$ 

 $H = UH_0U^{\dagger} + O(\epsilon^2), \qquad U = \exp\left(-\frac{i}{2}\epsilon\{p,A\}\right)$ 

 $UxU^{\dagger} = x + \epsilon A + O(\epsilon^2)$ 

Suppose  $\mathcal{O}$ ,  $\mathcal{O}'$  are leading effective operators (the other cases are similar)

Make a change of variables

To leading order

There is also a Jacobian

- $\mathcal{A}$  local  $\Rightarrow$   $\mathbf{J} \propto \delta^{(4)}(0)$  & its derivatives
- $\Rightarrow$  **J**  $\rightarrow$  0 in dim. reg.

[in general: **J** = renormalization effect]

$$\mathcal{L}_{\text{eff}} = \mathcal{L}_0 + \epsilon \left( c'\mathcal{O}' + c\mathcal{O} + \cdots \right) + O(\epsilon^2)$$

$$\phi \to \phi + \epsilon c' \mathcal{A}$$

$$\mathcal{L}_{\text{eff}} \to \mathcal{L}_0 + \epsilon \left( c' \mathcal{A} \frac{\delta S_0}{\delta \phi} + c' \mathcal{O}' + c \mathcal{O} + \cdots \right) + O(\epsilon^2)$$

$$\to \mathcal{L}_0 + \epsilon \left[ (c + ac') \mathcal{O} + \cdots \right] + O(\epsilon^2)$$

$$[d\phi] \to \text{Det} \left[ 1 + \epsilon c' \frac{\delta \mathcal{A}}{\delta \phi} \right] [d\phi]$$

$$\to \left\{ 1 + \epsilon c' \text{Tr} \left[ \frac{\delta \mathcal{A}}{\delta \phi} \right] \right\} [d\phi] = (1 + \epsilon c' \mathbf{J}) [d\phi]$$

# Gauge invariance

#### In all extensions of the SM

$$G_{\mathrm{SM}} \subset G_{\mathrm{tot}}$$

SM gauge group Full gauge group

 $\Rightarrow \mathcal{O} \text{ invariant under } G_{\mathrm{SM}}$ 
 $\mathcal{O}_{\mathrm{gauge-variant}} \stackrel{\mathrm{rad.corrections}}{\longrightarrow} \mathrm{ALL} \text{ gauge variant couplings}$ 

 $\Rightarrow$  a non-unitary theory

There is, however, a way of interpreting this.

Model with N vectorbosons  $W^n_{\ \mu}$  (n=1,2, ..., N) and other fields  $\chi$ 

Choose *any* Lie group **G** of dim.  $L \ge N$ , generated by  $\{T^n\}$  and add L-N non-interacting vectors  $W^n_{\ \mu}$  (n=N+1, ..., L)

Define a derivative operator

Introduce an auxiliary unitary field *U* in the fund. rep. of **G** 

Define gauge-invariantized gauge fields  $W^{n}_{\;\;\mu}$ 

Gauge invariant Lagrangian

$$\mathcal{L} = \mathcal{L}(W, \chi)$$

$$T^n = -T^{n\dagger}, \quad \operatorname{tr} T^n T^m = -\delta_{nm}$$

$$D_{\mu} = \partial_{\mu} + i \sum_{n=1}^{L} T^{n} W_{\mu}^{n}$$

$$\delta U = \sum_{n=1}^{L} \epsilon_n T^n U$$

$$\mathcal{W}_{\mu}^{n} = -\mathrm{tr}\left(T^{n}U^{\dagger}D_{\mu}U\right)$$

$$\mathcal{L}_{G.I.} = \mathcal{L}(W, \chi) \quad [\mathcal{L}(W, \chi)|_{U=1} = \mathcal{L}(W, \chi)]$$

- Any  $\mathcal L$  equals some  $\mathcal L_{\text{G.I.}}$  in the unitary gauge... but the  $\chi$  (matter fields) are gauge singlets
- Also  $\mathcal{L}_{\text{G.I.}}$  is non-renormalizable  $\Rightarrow$  valid at scales below ~4  $\pi$  m<sub>W</sub>
- The same group should be used throughout:

 $\mathcal{L}_{\text{dim} < 5}$  **G**-invariant  $\Rightarrow all \mathcal{L}_{\text{G.I.}}$  is **G**-invariant

# So gauge invariance *has* content:

- It predicts relations between matter couplings (most  $\chi$  are *not* singlets)
- If we assume a part of the Lagrangian is invariant under a **G**, all the Lagrangian has the same property

 $\Rightarrow$  S<sub>eff</sub> is invariant under  $\mathbf{G}_{SM}$ 

EFT course - HRI 3.2017 27

# Example

Zignt = 
$$\frac{1}{2}(3\phi)^2 - \frac{1}{2}m'\phi^2 - \frac{1}{12}\lambda\phi^4$$

Zz symmetry + Lor. invariance

 $0 \approx 3^{2h}\phi^{2k}$ ;  $\dim = n+k$ 
 $\lim_{n \to k} \inf \lim_{n \to k} \lim_{n \to k}$ 

# Renormalization

For a generic operator

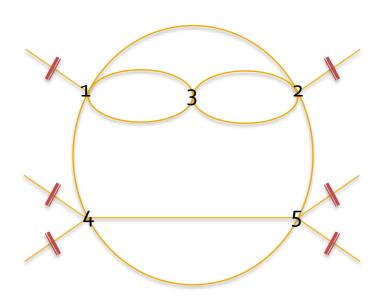

$$\mathcal{O} \sim D^d B^b F^c$$

B=boson field, F=fermion field. Its coefficient will be the form

$$c_{\mathcal{O}} \sim \lambda(b, f) \Lambda^{-\Delta_{\mathcal{O}}}$$

$$\Delta_{\mathcal{O}} = \dim(\mathcal{O}) - 4 = b + \frac{3}{2}f + d - 4$$

# A divergent L-loop graph generated by $\mathcal{O}_{\nu}$ renormalizing $\mathcal{O}$ :

Naïve degree of divergence

Naive degree of divergence 
$$\Delta_{\mathcal{O}} = \dim(\mathcal{O}) - 4$$
 
$$N_{\rm div} = 4L - 2I_b - I_f + \sum d_v - d = \sum \Delta_{\mathcal{O}_v} - \Delta_{\mathcal{O}}$$

30 3.2017

#### Power of $\Lambda$ :

$$\begin{cases}
 \text{each } \mathcal{O}_v : & -\Delta_{\mathcal{O}_v} \\
 \text{divergence :} & \mathbb{N}_{\text{div}}
\end{cases} \to \mathbb{N}_{\text{div}} - \sum \Delta_{\mathcal{O}_v} = -\Delta_{\mathcal{O}}$$

Use  $\Lambda$  as a cutoff

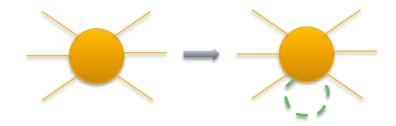

### Radiative corrections to $\lambda(b,f)$

$$\delta\lambda(b,f) \sim (16\pi^2)^{-L} \prod_{v} \lambda(b_v, f_v)$$

Naturality: for *αny* graph

$$\lambda(b, f) \sim \delta\lambda(b, f)$$

Replace  $\mathcal{O}_{\mathsf{v}} \to \mathsf{B}^2 \, \mathcal{O}_{\mathsf{v}}$ 

$$\lambda(b_v + 2, f_v) \times \frac{1}{16\pi^2} = \lambda(b_v, f_v) \quad \Rightarrow \quad \lambda(b, f) = (4\pi)^{b-1}\lambda(1, f)$$

# Similarly, for fermions

$$\lambda(b, f) = (4\pi)^{f-2}\lambda(b, 2)$$

# Combining everything:

$$\lambda(b,f) = (4\pi)^{N_{\mathcal{O}}}, \quad N_{\mathcal{O}} = b + f - 2$$

$$N_{\mathcal{O}} = b + f - 2$$

# TWO TYPES OF DIVERGENCES

# Logarithmic divergences generate the RG

If N<sub>div</sub>=0

$$\delta c_{\mathcal{O}} \sim \frac{(4\pi)^{N_{\mathcal{O}}}}{\Lambda^{\Delta_{\mathcal{O}}}} \times (\text{power of } \ln \Lambda)$$

• If  $N_{div}$ >0 there is a log <u>sub</u>divergence

$$\delta c_{\mathcal{O}} \sim \frac{(4\pi)^{N_{\mathcal{O}}}}{\Lambda^{\Delta_{\mathcal{O}}}} \times \left(\frac{m}{\Lambda}\right)^{N_{\text{div}}} \times (\text{power of } \ln \Lambda)$$

# Leading RG effects from $N_{div}$ =0

$$\sum_{v} \Delta_{\mathcal{O}_{v}} = \Delta_{\mathcal{O}}; \qquad (\mathtt{N}_{\mathtt{div}} = 0).$$

# Super-renormalizable (SR) vertices:

- $\Delta_{\mathcal{O}}$  ≥ o except SR vertices:  $\Delta_{\mathsf{SR}}$ =-1
- If the SR vertex  $\sim \Lambda \ \phi^3$  then  $m_{\phi} \sim \Lambda$
- Natural theories: SR vertices 

  light scale
- Natural theories: SR vertices → subleading
   RG effects

Ignoring SR vertices  $\rightarrow \Delta_{\mathcal{O}} \ge 0$ 

# THE OPERATOR INDEX AND THE BG

### The index of an operator is defined by

$$s_{\mathcal{O}}(u) = \Delta_{\mathcal{O}} + \frac{u-4}{2}N_{\mathcal{O}} = \frac{u-2}{2}b + \frac{u-1}{2}f + d - u$$
 Real parameter: 
$$0 \le u \le 4$$

#### Then

$$N_{\rm div} = \sum s_{\mathcal{O}_v} - s_{\mathcal{O}} + (4 - u)L$$

#### RG:

$$\begin{array}{ll} & \mathrm{N_{div}} = \mathbf{0} \\ & \Delta_{\mathcal{O}} \geq \mathbf{0} \end{array} \Rightarrow s_{\mathcal{O}} = \sum s_{\mathcal{O}_v} + (4-u)L \geq \sum s_{\mathcal{O}_v} \geq s_{\mathcal{O}_v} \end{array}$$

The RG running of  $c_{\mathcal{O}}$  is generated by operators or lower or equal indexes.

If

$$\mathcal{L}_{ ext{eff}} = \sum_{ ext{index}=s} \mathcal{L}_s$$

RG evolution of  $\mathcal{L}_s$  generated by  $\mathcal{L}_{s'}$  with  $s' \leq s$ 

EFT course - HRI

For u=1, d≥1, and b=0: s = d-1

•  $arLambda_{\psi}$ : natural scale

Hierarchy: der. expansion

• Higher  $s \rightarrow$  subdominant

For u=2: s = d + f/2 - 2

•  $\Lambda_{\phi}$ : natural scale

Hierarchy: der. & ferm. # expansion

• Higher  $s \rightarrow \text{subdominant}$ 

For u=4: s = d + b + (3/2)f - 4

•  $\Lambda$ : natural scale

No suppression factor

$$s_{\mathcal{O}} = (\dim \text{ of } \mathcal{O} - 4) + \frac{u - 4}{2} (\# \text{ fields in } \mathcal{O}) - u$$
  
$$= d + \left(\frac{u}{2} - 1\right)b + \frac{u - 1}{2}f - u$$

$$\mathcal{O} \sim \frac{1}{\Lambda_{\psi}^{\Delta} (4\pi)^{2s/3}} \psi^f D^d, \quad \Lambda_{\psi} = \frac{\Lambda}{(4\pi)^{2/3}}$$

s independent of f

$$\mathcal{O} \sim \frac{1}{\Lambda_{\phi}^{\Delta} (4\pi)^s} \phi^b \psi^f D^d \,, \quad \Lambda_{\phi} = \frac{\Lambda}{4\pi}$$

s independent of b

$$\mathcal{O} \sim \frac{1}{\Lambda^{\Delta}} \phi^b \psi^f D^d$$

# This approach also gives a natural estimate for the $c_{\mathcal{O}}$ (aside from power of a scale)

### **Examples**

#### Nonlinear SUSY:

$$\mathcal{L} = -\frac{1}{2\kappa^2} \det A, \qquad A^a_\mu = \delta^a_\mu + i\kappa^2 \psi \sigma^a \stackrel{\leftrightarrow}{\partial}_\mu \bar{\psi}$$

$$\mathcal{O} \sim \psi^f D^d$$
,  $c_{\mathcal{O}} \lesssim \frac{1}{\Lambda_{\psi}^{\Delta} (3\pi)^{2(d-1)/3}} \Rightarrow \kappa \lesssim \frac{1}{(4\pi)^{1/3} \Lambda_{\psi}^2}$ 

## Chiral theories (low-energy hadron dynamics):

### Simplest case: no fermions

$$U = \exp\left(\frac{i}{f_{\pi}}\boldsymbol{\sigma}.\boldsymbol{\pi}\right)$$

$$\mathcal{L} = -f_{\pi}^{2} \operatorname{tr} \partial_{\mu} U^{\dagger} \partial^{\mu} U + \bar{c}_{4}^{(1)} \left[ \operatorname{tr} \partial_{\mu} U^{\dagger} \partial^{\mu} U \right]^{2} + \dots + \frac{\bar{c}_{2n}}{f_{\pi}^{2n-4}} \times \left[ \partial^{2n} \operatorname{terms} \right] + \dots$$

$$\mathcal{O} \sim \phi^b \psi^f D^d$$
,  $c_{\mathcal{O}} \lesssim \frac{1}{\Lambda_{\phi}^{\Delta} (4\pi)^{d-2}} \Rightarrow f_{\pi} = \Lambda_{\phi}$ ,  $\bar{c}_d \lesssim (4\pi)^{2-d}$ 

## PTG operators

- Strongly coupled NP: NDA estimates of  $c_{\mathcal{O}}$
- For weakly coupled NP:  $c_{\mathcal{O}} < 1/\Lambda^{\Delta}$  ... but we can do better.
  - If  $\mathcal{O}$  is generated at tree level then

$$c_{\mathcal{O}} = \prod (couplings)/\Lambda^{\Delta}$$

• If  $\mathcal{O}$  is generated by at  $\mathsf{L}$  loops then

$$c_{\mathcal{O}} \sim \prod (\text{couplings}) / [(16\pi^2)^L \Lambda^{\Delta}]$$

Assume the SM extension is a gauge theory.

We can then find out the  $\mathcal{O}$  that are *always* loop generated.

The remaining  $\mathcal{O}$  may or may not be tree generated: I call them "Potentially Tree Generated" (PTG) operators.

To find the PTG operators we need the allowed vertices.

**NB:** I assume there are no heavy-light <u>quadratic</u> mixings (can always be ensured)

#### **Vector interactions**

3.2017

EFT course - HRI 42

Multi-vector vertices come from the kinetic Lagrangian

Cubic vertices  $\propto$  f Quartic vertices  $\propto$  f f

**V** = { **A** (light), **X**(heavy)}

Light generators close

This leads to the list of allowed vertices

In particular this implies that pure-gauge operators are loop generated

$$\mathcal{L}_{V} = -\frac{1}{4} V_{\mu\nu}^{a} V^{a\mu\nu} , \quad V_{\mu\nu}^{a} = \partial_{\mu} V_{\nu}^{a} - \partial_{\nu} V_{\mu}^{a} - g f_{abc} V_{\mu}^{b} V_{\nu}^{c}$$

$$[T_l, T_l] = T_l \quad \Rightarrow \quad f_{AAX} = 0$$

cubic: AAA, AXX, XXX

quartic: AAAA, AAXX, AXXX, XXXX

loop generated :  $\epsilon_{IJK}W_{\mu}^{I\nu}W_{\nu}^{J\rho}W_{\rho}^{K\mu}$  & etc.

## Vector-fermion interactions

3.2017

EFT course - HRI 43

Vertices with vectors and fermions come form the fermion kinetic term in  $\mathcal{L}$ 

$$\chi$$
 = { $\psi$  (light),  $\Psi$  (heavy)}

The *unbroken* generators  $T_l$  do not mix light and heavy degrees of freedom  $\Rightarrow$  **no**  $\psi \Psi A$  **vertex** 

Allowed vertices

$$\bar{\chi}i\not D\chi$$
,  $D_{\mu} = \partial_{\mu} + igT^{a}V_{\mu}^{a}$ 

with  $A: \psi \psi A, \ \Psi \Psi A$ 

with  $X: \psi \psi X, \ \Psi \Psi X, \ \psi \Psi X$ 

These come form the scalar kinetic term in L

$$\vartheta = {\phi \text{ (light), } \Phi \text{ (heavy) }}$$

Terms  $VV\vartheta\propto\langle\Phi
angle$ 

The (unbroken)  $\mathbf{t_l}$  do not mix  $\phi$  and  $\Phi$ 

The vectors  $\mathbf{t_h} \left< \varPhi \right>$  point along the Goldstone directions then

- $\mathsf{t}_\mathsf{h} \left< \Phi \right> \perp \phi$  (physical) directions
- $\mathsf{t}_\mathsf{h} \left\langle arPhi 
  ight
  angle \perp arPhi$  (physical) directions

Gauge transformations do not mix  $\phi$  (light & physical) with the Goldstone directions

$$|D\vartheta|^2, \quad D_\mu = \partial_\mu + igt^a V_\mu^a$$

$$(\langle \Phi \rangle t^a t^b \vartheta) V_{\mu}^a V^{b\mu}, \quad t_{\text{light}} \langle \Phi \rangle = 0$$

$$\langle \Phi \rangle t_{\text{heavy}} t^a \phi = 0$$

## Scalar-vector interactions (conclude)

2 2017

EFT course - HRI

This leaves 14 allowed vertices (out of 25)

 $\vartheta\vartheta V: \quad \phi\phi A, \ \Phi\Phi A$ 

 $\phi\phi X, \ \Phi\Phi X, \ \phi\Phi X$ 

 $\vartheta\vartheta VV: \quad \phi\phi AA, \ \Phi\Phi AA$ 

 $\phi\phi AX$ ,  $\Phi\Phi AX$ ,  $\phi\Phi AX$ 

 $\phi\phi XX, \ \Phi\Phi XX, \ \phi\Phi AX$ 

 $\theta VV: \quad \phi XX, \; \Phi XX$ 

The forbidden vertices are

 $\phi\phi\phi \quad \phi\Phi A \quad \psi\Psi A$  cubic:  $\phi AA \quad \phi AX \quad \phi XX$ 

 $\Phi AA \quad \Phi AX \quad AAX$ 

quartic:  $\phi \Phi AA \quad AAAX$ 

# Application: tree graphs suppressed by 1/\$\Lambda^2\$ or 1/\$\Lambda\$

3.2017

39 PTG operators (assuming B conservation)

## PTG operators are of 5 types

- Only Higgs  $\sim \phi^6$ ,  $\phi^2 \Box \phi^2$
- T parameter  $\sim |\phi^\dagger D \phi|^2$
- Yukawa like  $\sim |\phi|^2 (\bar{\psi}\psi'\phi)$
- W,Z couplings  $\sim (\phi^{\dagger}D_{\mu}\phi)(\bar{\psi}\gamma^{\mu}\psi')$
- 4 fermion  $\sim (\psi_1 \Gamma_a \psi_2)(\psi_3 \Gamma^a \psi_4)$

## Some phenomenology

Phenomenologically: the amplitude for an observable receives 3 types of contributions

Generic observable
$$= (\text{Generic observable})_{SM \text{ tree}} + (\text{Geop})_{SM \text{ loop}} + (\text{Geop})_{eff}$$

#### where

- $\sim (\alpha/4\pi) (\omega)_{\rm SM \, loop} \sim (\alpha/4\pi) (\omega)_{\rm SM \, tree}$
- $(\text{GC})_{\text{eff}} \sim (\text{E2 c}_{\mathcal{O}}/\Lambda^2) \ (\text{GC})_{\text{SM tree}}$

Easiest to observe the NP for PTG operators

Some limits on  $\Lambda$  are very strict: for  $\mathcal{O} \sim \text{eedd: } \Lambda > \text{10.5}\,\text{TeV}$ 

 $\Rightarrow$  is NP outside the reach of LHC?

Not necessarily. Simplest way: a new symmetry

- All heavy particles transform non-trivially
- All SM particles transform trivially
- $\Rightarrow$  <u>all</u> dim=6  $\mathcal{O}$  are loop generated (no PTG ops)

and the above limit becomes  $\Lambda$  > 840 GeV

### **Examples:**

SUSY: use R-parity

 Universal higher dimensional models: use translations along the compactified directions

## Decoupling theorem (w/o proof)

Theory with light ( $\phi$ ) and heavy ( $\Phi$ ) fields of mass O( $\Lambda$ )

$$- S = S_{l}[\phi] + S_{h}[\Phi, \phi]$$

-  $S_1 \rightarrow$  renormalizable

• exp( i  $S[\phi]$ ) =  $\int [d\Phi] \exp(i S_h)$ 

#### Then

$$S = S_{divergent} + S_{eff}$$

- S<sub>divergent</sub> renormalizes S<sub>I</sub>
- For large  $\varLambda$ 
  - $S_{eff} = \int d^4x \sum c_{\mathcal{O}} \mathcal{O}$
  - $c_{\mathcal{O}}$  finite
  - $\mathsf{c}_\mathcal{O} \! o \! 0$  as  $arLambda \to \infty$

## Limitations

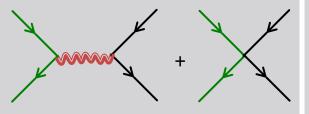

#### The formalism fails if

- $\mathcal{L}_{\text{eff}}$  is used in processes with E >  $\Lambda$
- If some  $\mathcal{O}$  breaks a local symmetry
- If some  $c_{\mathcal{O}}$  are impossibly large

3.2017

EFT course - HRI

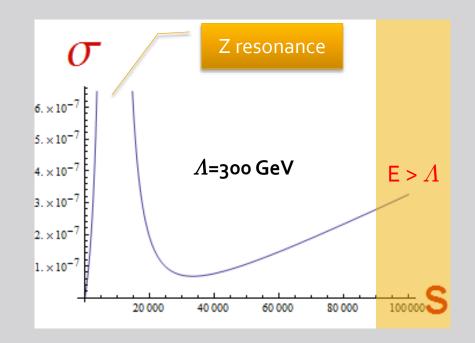

Consider ee  $ightarrow \mu 
u$ 

Then  $\sigma \! o \! \infty$  as  $\mathsf{E}_{CM} \! o \! \infty$ 

$$\sigma(e^+e^- \to \nu_\mu \bar{\nu}_\mu) = \frac{A s}{(s - m_Z^2)^2} + \frac{B s}{s - m_Z^2} + C s$$

$$A = \frac{1}{4\pi} \left( \frac{g}{4c_W} \right)^2 (1 - 4s_W^2)^2 \quad B = -\frac{1}{4\pi} \frac{g}{2c_W} \frac{c_{\mathcal{O}}}{\Lambda^2} (1 - 2s_W^2) \quad C = \frac{c_{\mathcal{O}}^2}{8\pi\Lambda^4}$$

A simple example: choose

.. C11003E

And calculate the 1-loop W

vacuum polarization  $arPi_W$ 

Then get the propagator poles s<sub>1</sub> and s<sub>2</sub>

If  $\lambda$  is independent of  $\Lambda$ : no light W

If  $\lambda \propto$  1/ $\Lambda^2$  the poles make physical sense

 $\mathcal{L}_{\text{eff}} = \mathcal{L}_{\text{SM}} - i \frac{\lambda e}{m_W^2} W_{\mu\nu}^+ W^{-\nu\rho} \left[ F_{\rho}{}^{\mu} + Z_{\rho}{}^{\mu} \right]$ 

$$\Pi_W = \frac{\lambda^2 g^2}{48\pi^2} \left(\frac{\Lambda}{m_W}\right)^2 \left[\frac{q^2}{5m_W^2} + 2 - \frac{6}{\lambda} - \frac{1}{2} \frac{\Lambda^2}{m_W^2}\right] q^2$$

$$q^2 \to s_1, \ s_2 \ \Rightarrow \ \langle TW^{\mu}W^{\nu}\rangle(q) = -\frac{\eta^{\mu\nu}}{q^2 + \Pi_W - m_W^2} \to \infty$$

$$s_1 \propto -\frac{m_W^4}{\Lambda^2}$$
  $s_2 \propto \Lambda^2$ 

$$s_1 \sim m_W^2$$
  $s_2 \sim \Lambda^2$ 

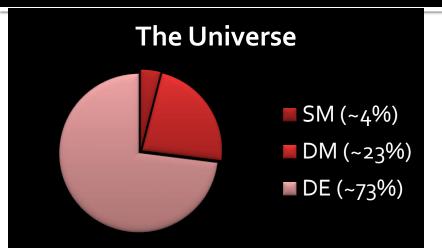

## Applications

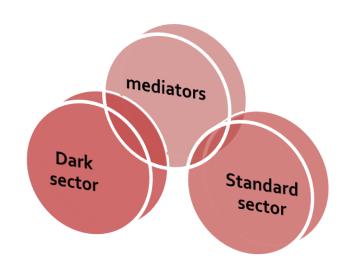

Collider phenomenology DM

LNV

Higgs couplings

## DM

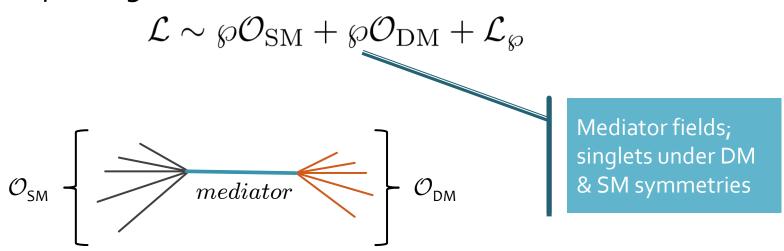

#### **Assumptions:**

- standard & dark sectors interact via the exchange of heavy mediators
- DM stabilized against decay by some symmetry G<sub>DM</sub>
- SM particles: **G**<sub>DM</sub> singlets
- Dark particles: G<sub>SM</sub> singlets
- Weak coupling

## EFFECTIVE THEORY OF PM-SM INTERACTIONS

epton doublet.

(2)Loop generated:  $B_{\mu\nu}X^{\mu\nu}\Phi B_{\mu\nu}\bar{\Psi}\sigma^{\mu\nu}\Psi$ 

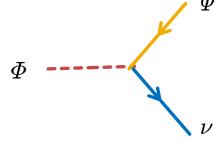

EFT course - HRI 61 3.2017

## **KPORTAL SCENARIO**

Dark sector: at least  $\Phi \& \Psi$ 

 $m_{\Phi} > m_{\Psi} \Rightarrow all \Phi's$  have decayed: fermionic DM.

$$(\bar{\ell}\tilde{\phi})(\Phi^{\dagger}\Psi) \rightarrow \frac{v}{\sqrt{2}}\bar{\nu}_L\Phi^{\dagger}\Psi$$

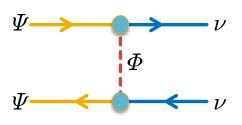

Important loop-generated couplings

$$i(\phi^{\dagger} \stackrel{\leftrightarrow}{D}_{\mu} \phi)(\bar{\Psi}_{L,R}\gamma^{\mu}\Psi_{L,R})$$

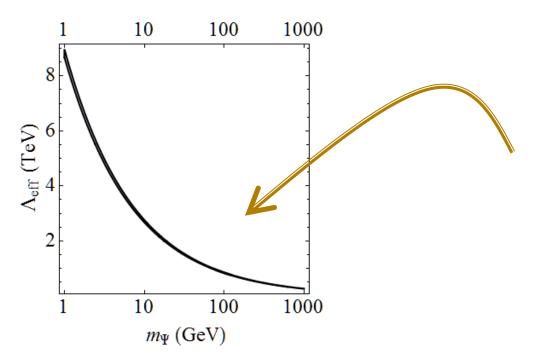

## RELIC ABUNDANCE

$$\langle \sigma v \rangle_{\Psi\Psi \to \nu\nu} \simeq \frac{(v/\Lambda_{\rm eff})^4}{128\pi m_{\Psi}^2} \,, \qquad \Lambda_{\rm eff} = \frac{\Lambda}{f} \sqrt{1 + \frac{m_{\Phi}^2}{m_{\Psi}^2}}$$

$$\Lambda_{\text{eff}} = \frac{\Lambda}{f} \sqrt{1 + \frac{m_{\Phi}^2}{m_{\Psi}^2}}$$

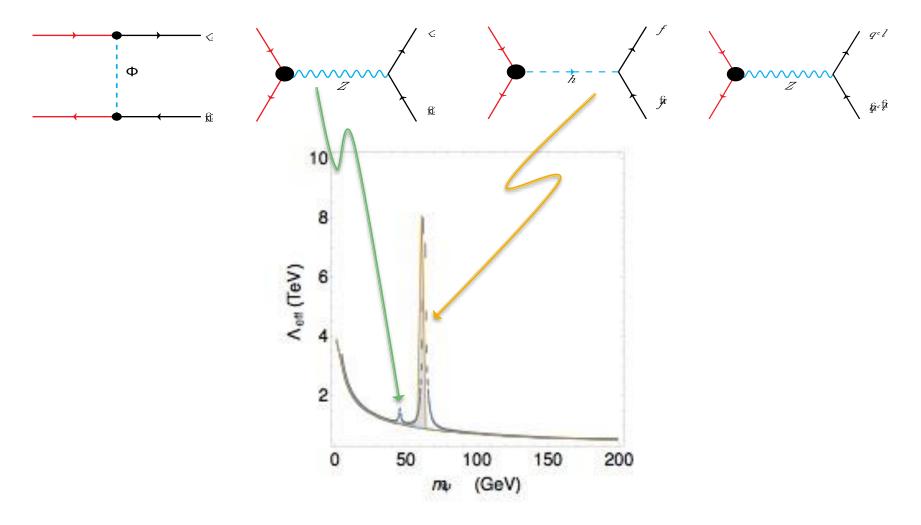

The Planck constraints fix

$$\Lambda_{\rm eff}$$
 =  $\Lambda_{\rm eff}$ (m $_{\Psi}$ )

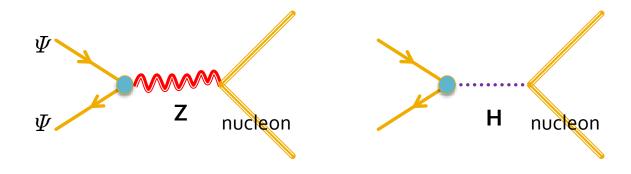

NB:

Large  $\Lambda_{\rm eff}$   $\Rightarrow$  small m $_{\Psi}$ Small  $\sigma \Rightarrow$  small  $m_{\psi}$ 

# More refined treatment: include Z and H resonance effects.

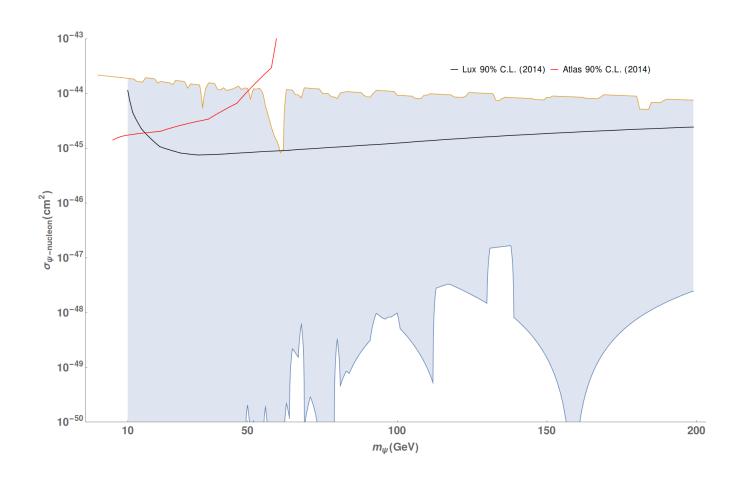

## RIRECT RETECTION

$$\mathcal{L} = \frac{\epsilon_h}{v^2} (\bar{\Psi}\Psi)(\bar{\mathcal{N}}\mathcal{N}) + \frac{1}{v^2} \bar{\Psi}\gamma_\mu (\epsilon_L P_L + \epsilon_R P_R) \Psi J_{\mathcal{N}}^\mu$$

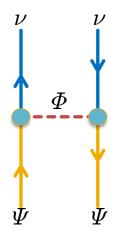

Nucleonic weak current

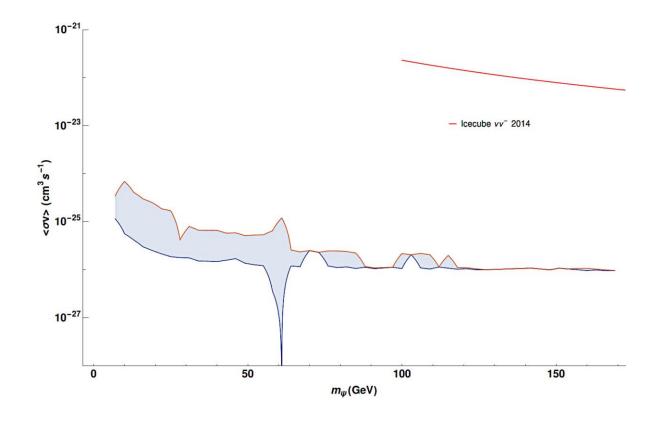

# Results: easy to accommodate LUX (and other) limits.

## INRIRECT RETECTION

### Expect monochromatic neutrinos of energy $m_{\psi}$ ;

## **UV COMPLETION**

#### Add neutral fermions N to the SM:

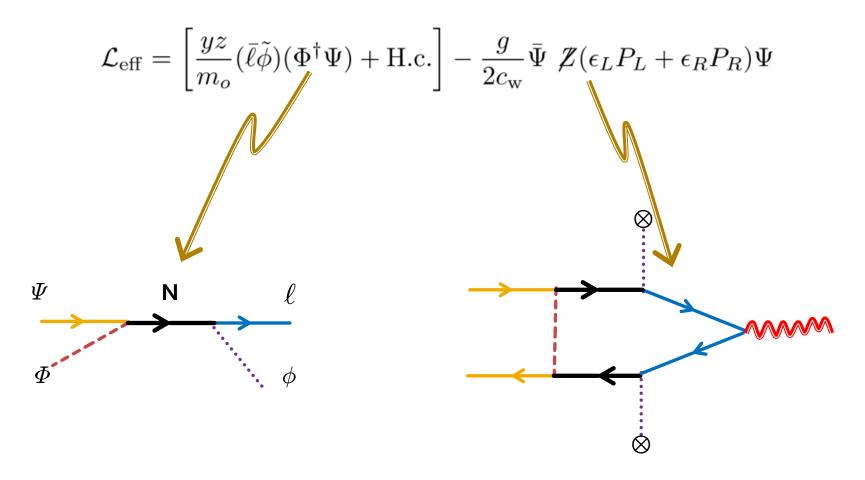

$$\mathcal{L} = \bar{N}(i \not \partial - m_o)N + (y \bar{\ell} \tilde{\phi} N + \text{H.c}) + (z \bar{N} \Phi^{\dagger} \Psi + \text{H.c})$$

Mass eigentsates:  $n_L$  (mass=0), and  $\chi$  (mass=M)

$$N = -s_{\theta} n_L + (c_{\theta} P_L + P_R) \chi , \qquad \nu = c_{\theta} n_L + s_{\theta} \chi_L$$
$$\tan \theta = yv/m_o ; \quad M = \sqrt{m_o^2 + (yv)^2}$$

$$\epsilon_L = \left| \frac{yvz}{4\pi m_o} \right|^2, \quad \epsilon_R = \left| \frac{yvz}{4\pi m_o} \right|^2 \ln \left| \frac{m_{\Phi}}{m_o} \right|$$

### Large $m_o$ :

In a model the  $c_0$  may be correlated  $\Rightarrow$  more stringent bounds

For this model a strong constraint comes from

 $\Gamma$  (Z  $\rightarrow$  invisible)

This rules out  $m_{\psi}$  > 35 GeV unless  $m_{\phi} \sim m_{\psi}$ 

## Higgs - simplified

#### Phenomenological description:

$$\mathcal{L}_{eff} = \frac{H}{v} \left[ \left( 2c_W M_W^2 W_{\mu}^- W_{\mu}^+ + c_Z M_Z^2 Z_{\mu}^2 \right) + c_t m_t t \bar{t} + c_b m_b b \bar{b} + c_\tau m_\tau \tau \bar{\tau} \right] + \frac{H}{3\pi v} \left[ c_\gamma \frac{2\alpha}{3} F_{\mu\nu}^2 + c_g \frac{\alpha_S}{4} G_{\mu\nu}^2 \right].$$

Experiments measure the  $c_i$ 

 $\Rightarrow$  need to relate these couplings to the c<sub>O</sub>

The relevant  $\mathcal{O}$  can be divided into 3 groups

- Pure Higgs
- O affecting the H-W and H-Z couplings
- O affecting the couplings of H, Z and W to the fermions

3.2017 EFT course - HRI

71

EFT course - HRI

There are two of them

The first changes the normalization of H

Canonically normalized field

Must replace  $h \rightarrow H$  *everywhere* 

The second operator changes v: absorbed in finite renormalizations

This operator can be probed only by measuring the Higgs selfcoupling.

$$\mathcal{O}_{\partial\varphi} = \frac{1}{2} (\partial_{\mu} |\varphi|^2)^2 \quad \mathcal{O}_{\varphi} = |\varphi|^6 \qquad \qquad \varphi = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v+h \end{pmatrix}$$

$$\mathcal{L} = \mathcal{L}_{SM} + \frac{c_{\partial \varphi}}{\Lambda^2} \mathcal{O}_{\partial \varphi} + \dots \approx \frac{1}{2} (1 + \epsilon c_{\partial \varphi}) (\partial h)^2 + \dots$$

$$H = \sqrt{1 + c_{\partial\varphi}\epsilon} \ h \approx \left(1 + \frac{1}{2}c_{\partial\varphi}\epsilon\right)h$$
  $\epsilon = \frac{v^2}{\Lambda^2}$ 

# O modifying H-W and H-Z couplings

3.2017

EFT course - HRI

There is one PTG operator.

Contributes to the T oblique parameter.

The constraints on  $\delta \, {\rm T}$  imply this cannot affect the  ${\rm c_i}$  within existing experimental precision

All the rest are loop generated ⇒ neglect to a first approximation

 $\Rightarrow$  HZZ & HWW couplings are SM to lowest order.

$$\mathcal{O}_{\varphi D} = |\varphi^{\dagger} D \varphi|^2$$

$$\delta T = \left| \frac{\epsilon c_{\varphi D}}{\alpha} \right| \le 0.1$$

# H, W, Z coupling to fermions (begin)

3.2017

EFT course - HRI

First: vector or tensor couplings.

These are PTG or loop generated.

Limits on FCNC coupled to the Z suggest  $\Lambda$  is very large unless p=r

#### For c~1:

- $\mathcal{O}_{\phi\psi}$  involving leptons:  $\varLambda$  > 2.5 TeV
- $\mathcal{O}_{\phi\psi}$  involving quarks except the top:  $\Lambda$  > O(1 TeV)
- $\mathcal{O}_{\text{qud}}: \Lambda > O(1 \text{ TeV})$

O(1%) corrections to the SM: ignore

	PTG	LG		
$\mathcal{O}_{arphi l}^{(1)}$	$(\varphi^{\dagger}i\overleftrightarrow{D}_{\mu}\varphi)(\overline{l}_{p}\gamma^{\mu}l_{r})$	$\mathcal{O}_{eW}$	$(\bar{l}_p\sigma^{\mu\nu}e_r)\tau^I\varphi W^I_{\mu\nu}$	
$\mathcal{O}_{\varphi l}^{(3)}$	$(\varphi^{\dagger}i\overleftrightarrow{D}_{\mu}^{I}\varphi)(\overline{l}_{p}\tau^{I}\gamma^{\mu}l_{r})$	$\mathcal{O}_{eB}$	$(ar{l}_p\sigma^{\mu u}e_r)arphi B_{\mu u}$

Family index

# H coupling to fermions (concluded)

3.2017

EFT course - HRI

#### There are also scalar couplings

In unitary gauge  $\varphi |\varphi|^2 = (\epsilon/2) (v + 3 H + \cdots)/\sqrt{2}$ 

 $\epsilon$  v contributions: absorbed in finite renormalization. GIM mechanism survives.

 $\epsilon$  H contributions: observable deviations form the SM

$$(\mathcal{O}_{e\varphi})_{pr} = |\varphi|^2 \bar{\ell}_p e_r \varphi,$$

$$(\mathcal{O}_{u\varphi})_{pr} = |\varphi|^2 \bar{q}_p u_r \tilde{\varphi},$$

$$(\mathcal{O}_{d\varphi})_{pr} = |\varphi|^2 \bar{q}_p d_r \varphi,$$

In most cases these are ignored, but since  $H \to \gamma \gamma$ ,  $Z\gamma$ , GG are LG in the SM,  $\mathcal{O}_{LG}$  whose contributions interfere with the SM should be included.

Operators containing the dual tensors do not interfere with the SM: they are subdominant

$$\mathcal{O}_{\varphi X} = \frac{1}{2} |\varphi|^2 X_{\mu\nu} X^{\mu\nu} \,, \quad X = \{ G^A, W^I, B \}$$

$$\mathcal{O}_{WB} = \left( \varphi^{\dagger} \tau^I \varphi \right) W^I_{\mu\nu} B^{\mu\nu}$$

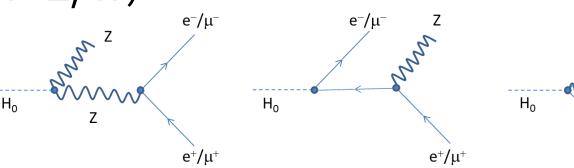

### PHENOMENOLOGICAL IMPLICATIONS

$$H \rightarrow \psi \psi$$

$$\Gamma(H \to \bar{\psi}\psi) = \kappa_{\psi}^{2} \Gamma_{SM}(H \to \bar{\psi}\psi)$$

$$\kappa_{\psi}^{2} = \left(1 - c_{\partial\phi}\epsilon + \frac{\sqrt{2}\,v}{m_{\psi}}c_{\psi\varphi}\epsilon\right).$$

$$H \rightarrow VV^* \quad (V=Z, W)$$

$$\Gamma(H \to VV^*) = \kappa_V^2 \Gamma_{SM}(H \to VV^*)$$
$$\kappa_V^2 = (1 - c_{\partial \phi} \epsilon)$$

 $e^{-}/\mu^{-}$ 

## $H \rightarrow \gamma \gamma$ , $\gamma Z$ , GG

$$\Gamma(H \to \gamma \gamma) = \kappa_{\gamma \gamma}^2 \Gamma_{SM}(H \to \gamma \gamma) \qquad \kappa_{\gamma \gamma}^2 = 1 - \epsilon \left( c_{\partial \phi} - 0.30 \tilde{c}_{\gamma \gamma} - 0.28 c_{t \varphi} \right)$$

$$\Gamma(H \to Z \gamma) = \kappa_{Z \gamma}^2 \Gamma_{SM}(H \to Z \gamma) \qquad \kappa_{Z \gamma}^2 = 1 - \epsilon \left( c_{\partial \phi} - 1.82 \tilde{c}_{Z \gamma} - 1.46 c_{t \varphi} \right)$$

$$\Gamma(H \to GG) = \kappa_{GG}^2 \Gamma_{SM}(H \to GG) \qquad \kappa_{GG}^2 = 1 - \epsilon \left( c_{\partial \phi} - 2.91 \tilde{c}_{GG} - 4 c_{t \varphi} \right)$$

### where

$$\tilde{c}_{\gamma\gamma} = \frac{16\pi^2}{g^2} c_{\varphi W} + \frac{16\pi^2}{g'^2} \tilde{c}_{\varphi B}$$

$$\tilde{c}_{Z\gamma} = \frac{16\pi^2}{eg} \left[ \frac{1}{2} (c_{\phi W} - c_{\phi B}) s_{2w} - c_{WB} c_{2w} \right]$$

$$\tilde{c}_{GG} = \frac{16\pi^2}{g_s^2} c_{\varphi G}$$

EFT course - HRI

## A SPECIAL CASE

## If there are no tree-level generated operators:

$$\Rightarrow c_{\mathcal{O}} \sim 1/(16\pi^2) \quad \tilde{c}_{\gamma\gamma,\gamma Z,GG} \sim 1$$

### and

$$\frac{\sigma^{\mathrm{prod}}}{\sigma_{SM}^{\mathrm{prod}}} - 1 = 2.91 \,\epsilon \, \tilde{c}_{GG}$$
 
$$\frac{B(H \to VV^*)}{B_{SM}(H \to VV^*)} - 1 = -0.25 \,\epsilon \, \tilde{c}_{GG}$$
 
$$\frac{B(H \to \gamma\gamma)}{B_{SM}(H \to \gamma\gamma)} - 1 = \epsilon \, (0.3 \tilde{c}_{\gamma\gamma} - 0.249 \tilde{c}_{GG})$$

## LNV & EFT

3.2017

There is a single dimension 5 operator that violates lepton number (LN) – assuming the SM particle content:

$$\mathcal{O}_{rs}^{(5)} = N_r^T C N_s \quad N_r = \phi^T \epsilon \ell_r, \ \epsilon = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}.$$

Note that it involves only left-handed leptons!

Different chiralities have different quantum numbers, different interactions and different scales. The scale for  $\mathcal{O}^{(5)}$  is large, what of the scales when fermions of other chiralities are involved?

EFT course - HRI 80

Operator with  $\ell$  and e:

$$\mathcal{O} \sim \ell e \phi^a \tilde{\phi}^b D^c$$
 with  $a - b = 3$  (dim =  $3 + a + b + c = 2a + c$ ).

Opposite chiralities  $\Rightarrow$  need an odd number of  $\gamma$  matrices  $\Rightarrow$  c=odd.

Try the smallest value: c=1. If the D acts on  $\ell$  and e:

$$D\!\!\!/\ell \to 0$$
  $D\!\!\!\!/e \to 0$ .

because of the equations of motion and the equivalence theorem.

The smallest number of scalars needed for gauge invariance is a=3, b=0. Then the smallest-dimensional operator has dimension 7:

$$\mathcal{O}_{rs}^{(7)} = (e_r^T C \gamma^{\mu} N_s) \left( \phi^T \epsilon D_{\mu} \phi \right).$$

Operator with two *e*:

$$\mathcal{O} \sim ee\phi^a \tilde{\phi}^b D^c$$
 with  $a - b = 4$  (dim =  $3 + a + b + c = 2a + c$ ).

Same chiralities  $\Rightarrow$  need an even number of  $\gamma$  matrices  $\Rightarrow$  c=even. Try the smallest number of  $\phi$ : a=4

Cannot have c=o: SU(2) invariance then requires the  $\phi$  contract into

$$\phi^T \epsilon \phi = 0.$$

Then try c=2; each must act on a  $\phi$  and must not get a factor of  $\phi$  <sup>T</sup>  $\epsilon$   $\phi$  . The only possibility is then

$$\mathcal{O}_{rs}^{(9)} = \left(e_r^T C e_s\right) \left(\phi^T D_\mu \phi\right)^2.$$

that has dimension 7:

3.2017

EFT course - HRI 82

### ον - ββ decay: introduction

EFT course - HRI

Some nuclei cannot undergo  $\beta$ decay, but can undergo  $2\beta$  decay because

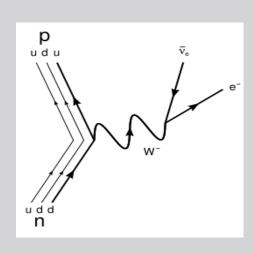

- $E_{bind}(Z) > E_{bind}(Z+1)$
- $E_{bind}(Z) < E_{bind}(Z+2)$

There are 35 nuclei exhibiting  $2\beta$ decay:

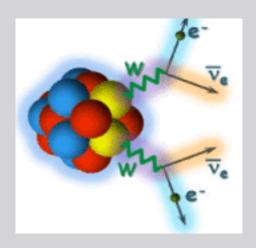

<sup>48</sup>Ca, <sup>76</sup>Ge, <sup>82</sup>Se, <sup>96</sup>Zr, <sup>100</sup>Mo, <sup>116</sup>Cd, <sup>128</sup>Te, <sup>130</sup>Te, <sup>136</sup>Xe, <sup>150</sup>Nd, 238**[ ]** 

It may be possible to have no  $\nu$  on the final state (LNV process)

Best limits: Hidelberg-Moscow experiment

$$A_Z \to A_{Z+1} + e^- + \bar{\nu}_e$$

$$A_Z \to A_{Z+1} + e^- + \bar{\nu}_e$$
  $A_Z \to A_{Z+2} + 2e^- + 2\bar{\nu}_e$ 

$$T_{1/2}(\psi - \beta\beta) > 1.8 \times 10^{25} \text{years}$$

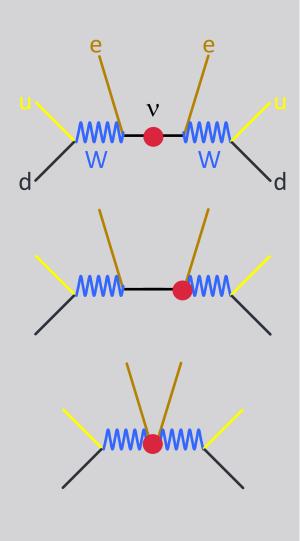

3.2017

EFT course - HRI 84

 $\epsilon = v/\Lambda$ 

Amplitude  $\simeq \mathcal{A}/(Q^2v^3)$ 

 $\eta = Q/v \simeq 2 \times 10^{-4}$ 

$$\bar{\ell}\tilde{\phi})C(\bar{\ell}\tilde{\phi}) \to \mathcal{A} = \epsilon$$

$$(\phi^{\dagger}D_{\mu}\tilde{\phi})\left[\bar{e}\gamma^{\mu}(\tilde{\phi}^{T}\ell^{c})\right] \to \mathcal{A} = \eta\epsilon^{3}$$

$$(\phi^{\dagger}D^{\mu}\tilde{\phi})^{2}(\bar{e}e^{c}) \to \mathcal{A} = \eta^{2}\epsilon^{3}$$

The implications of the lifetime limit depend strongly on the type of NP.

Amplitude 
$$\simeq \mathcal{A}/(Q^2v^3)$$
 $\epsilon = v/\Lambda$ 
 $\eta = Q/v \simeq 2 \times 10^{-4}$ 

dim of  $\mathcal{O} \mid \mathcal{A} \mid \Lambda_{\min}(\text{TeV})$ 

Limit:  $\mathcal{A} < 1.4 \times 10^{-12} \implies 5$ 
 $7$ 
 $\eta \epsilon^3$ 
 $\eta^2 \epsilon^3$ 
 $130$ 
 $9$ 
 $\eta^2 \epsilon^3$ 

If the NP generates the ee operator @ tree level it may be probed at the LHC

## Flavor physics: b parity

b – quark production in e<sup>+</sup> e<sup>-</sup> machines

$$e^+e^- \rightarrow nb + X$$

In the SM model the 3<sup>rd</sup> family (t,b) mixes with the other families, however

$$\mathcal{L}_{\text{SM-mix}} = -\frac{g}{\sqrt{2}} \left( \overline{u_L}, \, \overline{c_L}, \, \overline{t_L} \right) \, \mathcal{W}^+ \mathbb{V}_{\text{CKM}} \begin{pmatrix} d_L \\ s_L \\ b_L \end{pmatrix}$$

$$|V_{ub}| = (4.15 \pm 0.49) \times 10^{-3}$$
  $|V_{cb}| = (40.9 \pm 1.1) \times 10^{-3}$   $|V_{td}| = (8.4 \pm 0.06) \times 10^{-3}$   $|V_{ts}| = (42.9 \pm 2.6) \times 10^{-3}$ 

 $\Rightarrow$  neglecting  $V_{ub, cb, td, ts}$  there is a discrete symmetry:

### (-1) (# of b quarks) is conserved

In particular  $e^+e^- \rightarrow (2n+1) b + X$  is forbidden in the SM!

For non-zero V's this "b-parity" is almost conserved.

NP effects that violate b-parity are easier to observe because the SM ones are strongly suppressed.

#### Looked at the reaction

$$e^+e^- \rightarrow nb + mc + lj$$
 (j=light-quark jet)

#### Let

- $\epsilon_{\rm b}$  = efficiency in tagging (identifying) a b jet
- t<sub>i</sub> = probability of mistaking a j-jet for a b-jet
- t<sub>c</sub> = probability of mistaking a c-jet for a b-jet
- $\sigma_{\text{nml}} = \sigma (e^+ e^- \rightarrow \text{nb} + \text{mc} + \text{lj})$

Cross section for detecting k b-jets (some misidentified!):

$$\bar{\sigma}_k = \sum_{u+v+w=k} \binom{n}{u} \binom{m}{v} \binom{l}{w} \left[ \epsilon_b^u (1-\epsilon_b)^{n-u} \right] \left[ t_c^v (1-t_c)^{m-v} \right] \left[ t_j^w (1-t_j)^{l-w} \right] \sigma_{nml}$$

#### Let

 $N_{k,l}$  = # of events with k b-jets and J total jets (k=odd)

Then a 3-sigma deviation from the SM requires

$$|N_{kJ} - N_{kJ}^{SM}| > 3 \Delta$$

Where  $\Delta$  = error =  $[\Delta_{\text{stat}}^2 + \Delta_{\text{syst}}^2 + \Delta_{\text{theo}}^2]^{\frac{1}{2}}$ 

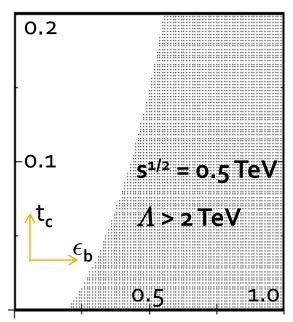

- $\Delta_{\text{stat}} = (N_{kJ})^{1/2}$
- $\Delta_{\text{syst}} = N_{\text{kJ}} \delta_{\text{s}}$
- $\Delta_{\text{theo}} = N_{kJ} \delta_{t}$

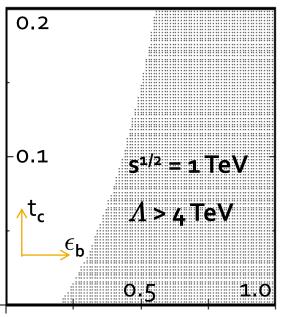

New physics:

$$\mathcal{L} = \frac{1}{\Lambda^2} (\bar{\ell} \gamma^{\mu} \ell) (\bar{q}_i \gamma_{\mu} q_j); \quad i, j = 1, 2, 3$$

$\delta_s = 0.05, \ \delta_t = 0.05, \ t_c = 0.1 \ \text{and} \ t_j = 0.02$					
$\sqrt{s}$	L	$\epsilon_b = 0.25$	$\epsilon_b = 0.4$	$\epsilon_b = 0.6$	
(GeV)	$\left  \text{ (fb}^{-1} \right  \right $				
200	2.5	0.68	0.74	0.81	
500	100	1.81	1.96	2.15	
1000	200	3.61	3.91	4.36	

 $3\sigma$  limits on  $\varLambda$  (in TeV ) derived from  $N_{\rm k=1,\,J=2}$ 

 $3\sigma$  allowed regions derived from  $N_{\rm k=1,\,J=2}$  when  $\delta_{\rm s}$  =  $\delta_{\rm t}$  = 0.05, t $_{\rm j}$  = 0.02

Because of the SM suppression, even for moderate efficiencies and errors one can probe up to  $\Lambda \sim$  3.5  $\sqrt{s}$
