

Construct $R_{\mu\nu} & R_{\mu\nu\sigma}$, which is
non-zero everywhere (unlike $R=0$)
We'll see $R_{\mu\nu} & R_{\mu\nu\sigma}$ is finite
at $f=2GM$

Every other scalar is finite.

One can find explicit coordinate
sys. such that in the new coordinate
system the metric is finite.

→ in that system the scalars are manifestly
finite - of course they are finite in
any other coord. sys. - ~~only one~~
~~coord. sys. where the singularity is not~~
original)

(The choice of the above coord. is for a
far-away observer)

The singular metric in the
coordinate system of an asymptotic
observer has interesting effects
→ Make this into a black hole

[We'll see if we start from a pt. $r < 2GM$
& follow a time-like curve, we can never
~~reach asymptotic~~ i.e., we can never come out
of the black hole] - time-like geodesics are
relevant because they give the
trajectory of massive particles - null-curves
also can't come out - only spacelike
curves can come out]

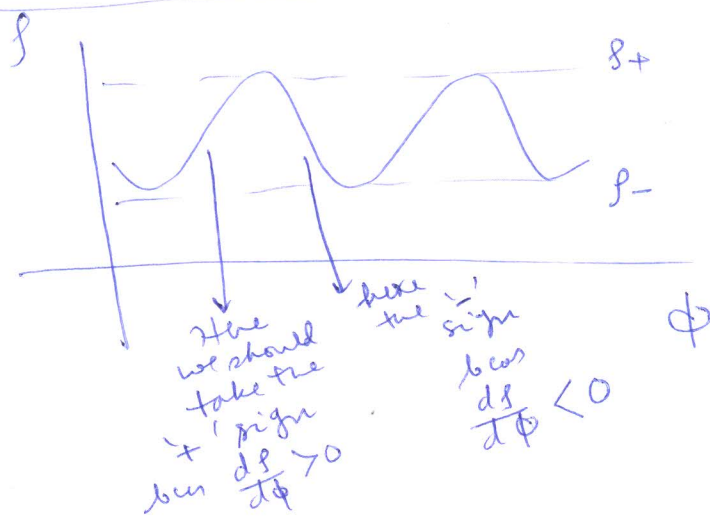

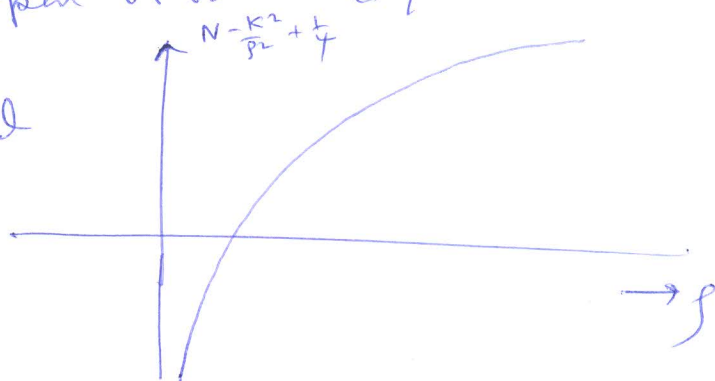

3/8/07

$$\frac{d\phi}{ds} = \pm \frac{K \sqrt{\chi(s)}}{s^2} \frac{1}{\left(N - \frac{K^2}{s^2} + \frac{1}{4}\right)^{1/2}}$$

As $s \rightarrow 0$, the curve is -ve, so the curve must cross the s -axis at least once — for bound orbit it must cross s -axis twice.

For open orbit ~~circle~~ / Unbounded orbit \Rightarrow

Whether it will be bound or unbound will be det. by N & K

(We determine s_+ / s_- by finding the zero(s) of $N - \frac{K^2}{s^2} + \frac{1}{4} \Rightarrow$

$$N - \frac{K^2}{s_+^2} + \frac{1}{4} = 0$$

$$N - \frac{K^2}{s_-^2} + \frac{1}{4} = 0$$

We get $N = \frac{1}{s_+^2 - s_-^2} \left\{ \frac{s_-^2}{\chi(s_-)} - \frac{s_+^2}{\chi(s_+)} \right\}$
